Background Information

Dupd1 also named as Dusp27, has been categorized as an atypical dual-specificity phosphatase (Dusp) capable of dephosphorylating both tyrosine and serine/threonine residues. It's involved in the modulation of intracellular signaling cascades. In skeletal muscle Dupd1 regulates systemic glucose homeostasis by activating AMPK, which is an energy sensor protein kinase. Dupd1 also affects MAP kinase signaling through modulation of the MAPK1/2 cascade in skeletal muscle promoting muscle cell differentiation, development and atrophy.
