Background Information

ELMO2 (Engulfment and cell motility protein 2), a member of the Elmo protein family, has been implicated in the regulation of Rac1 and Akt activation. ELMO2 is recruited to the plasma membrane and involved in the signaling cascade that controls cytoskeleton dynamics and cell migration (PMID: 27226625). ELMO2 is a cytoskeletal adaptor protein necessary for cell migration and apoptotic cell removal. Loss-of-function mutations in ELMO2, via impaired RAC1 signaling and defective vascular smooth muscles, as the causative factor for autosomal-recessive VMOS (PMID: 27476657).
