Background Information

KNL1 is a component of the multiprotein assembly that is required for creation of kinetochore-microtubule attachments and chromosome segregation. KNL1 functions as a scaffold for proteins that influence the spindle assembly checkpoint during the eukaryotic cell cycle and it interacts with at least five different kinetochore proteins and two checkpoint kinases. In adults, this gene is predominantly expressed in normal testes, various cancer cell lines and primary tumors from other tissues and is ubiquitously expressed in fetal tissues.
