Background Information

ALG9 encodes an endoplasmic reticulum enzyme that builds N-glycans, the third ER protein-encoding polycystic disease gene after GANAB and DNAJB11. Autosomal recessive loss of ALG9 results in a severe congenital disorder of glycosylation (CDG) with a multiorgan phenotype that includes kidney cysts (PMID: 31395617). Western blot analysis detected ALG9 at an apparent molecular mass of 70 kDa.
