Background Information

HDAC4 (Histone deacetylase 4) belongs to class II of the histone deacetylase/acuc/apha family. It possesses histone deacetylase activity and represses transcription when tethered to a promoter. Histone deacetylation gives a tag for epigenetic repression and plays a role in transcriptional regulation, cell cycle progression and developmental events. It is involved in muscle maturation by its interaction with the myocyte enhancer factors such as MEF2A, MEF2C and MEF2D. HDAC4 is required for TGFbeta1-induced myofibroblastic differentiation (PMID: 17610967). HDAC4 encoded by an allele associated with mental retardation is a gain-of-function nuclear repressor that abolishes transcription and synaptic transmission (PMID: 23141539).
