Background Information

PYCARD (PYD and CARD domain containing), also known as ASC and CARD5. The calculated molecular weight of PYCARD is 21 kDa. It is located in cytosol, extracellular region and nucleus. PYCARD is also expressed in several structures, including alimentary system; brain; heart; hemolymphoid system gland; and urinary system. The gene enables identical protein binding activity and protein dimerization activity. Involved in several processes, including activation of cysteine-type endopeptidase activity; positive regulation of cytokine production; and regulation of defense response. It acts upstream of or within several processes, including defense response to Gram-positive bacterium; positive regulation of macromolecule metabolic process; and regulation of autophagy. It is also a part of inflammasome complex. Finally, it orthologous to human PYCARD (PYD and CARD domain containing).
