Background Information

LYRM5, also known as ETFRF1, belongs to the Complex1_LYR-like Superfamily. LYRM5 is a mitochondrial protein and plays key roles in acetate metabolism, and in essential Fe-S cluster biogenesis. In vitro, LYRM5 was found to inhibit ETF by promoting the removal of flavin from the ETF holoenzyme, thus potentially regulating the rate of β -oxidation (PMID: 35402183, PMID: 36266680). The calculated molecular weight of LYRM5 is 11 kDa.
