| Background Information | | | | |
| | protein (SOX9) is a member of the SOX family of transcription factors (TFs) which are developmental regulators th possess high mobility group (HMG) box DNA binding and transactivation domains. It participates in a variety of functions, such as lineage restriction and terminal diferentiation, through precise temporal and spatial expression patterns that difer between particular cell types and tissues. SOX9 gene has been implicated in different types of cancer as an oncogene; however, it also may behave as a tumor suppressor. SOX9 can be ubiquitinated or SUMOylated to higher molecular weight (PMID: 24155239; 16307912; 16554309; 32070068) | | | |

Selected Validation Data

Various lysates were subjected to SDS PAGE followed by western blot with 55152-1-AP (SOX9 antibody) at dilution of 1:3000 incubated at room temperature for 1.5 hours.
