Background Information

NDE1 (NUDE / NUDE1) is a LIS1-interacting protein. A signaling pathway containing NDE1, LIS1, and cytoplasmic $dynein\ is\ conserved\ for\ eukaryotic\ nuclear\ migration\ and\ has\ profound\ impact\ on\ neuronal\ migration\ during$ development of the central nervous system. LIS1 and dynein have been shown to be involved in mitosis and NDE1 participates in a subset of dynein function in M phase. NDE1 is specifically phosphorylated in M phase in its serine/threonine phosphorylation motifs, probably by Cdc2 and also Erk1 and Erk2. A fraction of NDEl binds to centrosomes strongly in interphase and is localized to mitotic spindles in early M phase. Phosphorylation of NDE1 also regulates the cell-cycle-dependent distribution, possibly by increasing its dissociation rate at the microtubuleorganizing center. This antibody is speicific to NDE1 gene and it has no cross-reaction to NDEL1.
