Background Information	NSE, also named as ENO2, belongs to the enolase family. Enolases are cytoplasmic glycolytic enzymes that may be involved in differentiation. The enolase has three isoenzymes, alpha, beta and gamma. The alpha form is expressed in most tissues, whereas the beta form is expressed in muscle tissue. The gamma enolase (ENO2), a homodimer, is primarily localized in neurons and neuroendocrine cells and is a cancer diagnostic marker for brain tumors (PMID:7520111). ENO2 plays a role in the glycolysis-related energy pathway and might be involved in higher metabolic activity during the day than at night, at least in part.

## Selected Validation Data

Various lysates were subjected to SDS PAGE followed by western blot with 66150-1-1g (NSE antibody) at dilution of 1:50000 incubated at room temperature for 1.5 hours. The membrane was stripped and reblotted with HRP-conjugated GAPDH Monoclonal antibody (HRP-60004) as loading control.

1X10^6 SH-SY5Y cells were intracellularly stained with 0.2 ug Anti-Human NSE (66150-1-1g, Clone:6F8G3) and Coralite®488-Conjugated AffiniPure Goat Anti-Mouse lgG(H+L) at dilution 1:1000 (red), or 0.2 ug Control Antibody. Cells were fixed with 4% PFA and permeabilized with Flow Cytometry Perm Buffer (PF00011-C).

WB result of NSE antibody (66150-1-lg; 1:4000; incubated at room temperature for 1.5 hours) with sh-Control and sh-NSE transfected U-251 cells.

Immunohistochemical analysis of paraffinembedded mouse brain tissue slide using 66150-1-Ig (NSE antibody) at dilution of 1:5000 (under 10x lens). Heat mediated antigen retrieval with Tris-EDTA buffer (pH 9.0).
