## Background Information

Mucosa-associated lymphoid tissue lymphoma translocation protein 1 belongs to caspase-like protein superfamily. MALT1 plays a potential role in the regulation of apoptosis and induces NFκB activation and required for the normal development of B cells and for the activation of the IKK complex. It acts as a caspase and mediates additional functions related to T cell activation, cleaving both the ubiquitin editing enzyme, TNFAIP3, and the C terminus of BCL10. It has two isoforms. Researches showed that inhibition of MALT1 blocks A20 and BCL10 cleavage, reduces NFκB activity, and decreases the expression of NFκB targets BCLXL.
