Background Information

Deoxyribonuclease 1-like 3 (DNASE1L3, DNase gamma, DNase Y, LS-DNase) is member of a DNASE1 protein family that is identified by similar biochemical properties such as Ca2+/Mg2+- dependency and an optimal pH of about 7.0 as well as by a high similarity in their nucleic acid and amino acid sequences (PMID:157967140). It is an endonuclease and cleaves double-stranded DNA (and single-stranded DNA) producing 3′-OH/5′-P ends, which is Ca2+/Mg2+-dependent and inhibited by Zn2+, but not by monomeric actin (PMID:9665719). In addition, it translocates from the endoplasmic reticulum to the nucleus during apoptosis (PMID: 23229555). DNASE1L3 can be located either in the cytoplasm or in the nucleus.
