Background Information

PBLD, also termed as MAWBP, was first identified from a human liver cDNA library using a yeast two-hybrid technique by Iriyama et al. As the only representative of phenazine biosynthesis-like protein family, PBLD is widely expressed in human tissues, such as brain, heart, lung, liver, pancreas, kidney, and placenta. Its expression is elevated in several diseases processes, including insulin resistance, folate deficiency, and hypotension. PBLD has been proved to be involved in gastric carcinogenesis, PBLD expression was attenuated in gastric cancer (GC) tissues, and negatively regulated the growth and invasion in gastric cancer cell-lines by inhibiting TGF-β1-induced EMT (Epithelial-Mesenchymal Transition).
