Background Information

FAT1, also known as hFat1, belongs to a member of the cadherin superfamily, has been proposed to play roles in cerebral development, glomerular slit formation, and also to act as a tumor suppressor, but its mechanisms of action have not been elucidated. It is expected to be located in cell membrane and nucleus, which is expressed in many epithelial and some endothelial and smooth muscle cells. The calculated molecular weight of FAT1 is 506 kDa and there is glycosylation modification of the protein. To examine functions of the transmembrane and cytoplasmic domains, they were expressed in HEK-293 and HeLa cells as chimeric proteins in fusion with EGFP and extracellular domains derived from E-cadherin. Proteins comprising the transmembrane domain localized to the membrane fraction (PMID: 15922730, 26373379).

Selected Validation Data

HeLa cells were subjected to SDS PAGE followed by western blot with 84279-3-RR (FAT1 antibody) at dilution of 1:20000 incubated at room temperature for 1.5 hours.

Biolayer interferometry (BLI) kinetic assays of 84279-3-RR against Human FAT1 were performed. The affinity constant is 0.375 nM.
