Background Information

KISS1, also known as kisspeptin, is a metastasis suppressor protein that suppresses metastases of human melanomas and breast carcinomas without affecting tumorigenicity. It may regulate events downstream of cell-matrix adhesion, perhaps involving cytoskeletal reorganization. A C-terminally amidated peptide of KISS1, metastin (kisspeptin-54 or kp-54), functions as the endogenous ligand of the G-protein coupled receptor GPR54 (PMID: 11457843; 11385580). KISS1-GPR54 signaling is involved in the regulation of reproduction, playing an important role in initiating secretion of gonadotropin-releasing hormone (GnRH) at puberty (PMID: 18753370).

Selected Validation Data

Human placenta tissue lysate was subjected to SDS PAGE followed by western blot with 88055-1-RR (KISS1 antibody) at dilution of 1:2000 incubated at room temperature for 1.5 hours. This data was developed using the same antibody clone with 88055-1-PBS in a different storage buffer formulation.

Immunohistochemical analysis of paraffin-embedded human placenta tissue slide using 88055-1-RR (KISS1 antibody) at dilution of 1:1000 (under 40x lens). Heat mediated antigen retrieval with Tris-EDTA buffer (pH 9.0). This data was developed using the same antibody clone with 88055-1-PBS in a different storage buffer formulation.

Biolayer interferometry (BLI) kinetic assays of 88055-1-RR against Human KISS1 were performed. The affinity constant is 12.3 nM.
