Background Information

CD71, also known as transferrin receptor protein 1 (TfR1), is a transmembrane glycoprotein composed of two disulfide-linked monomers, each of 90 kDa molecular weight. Each monomer binds one holo-transferrin molecule creating an iron-Tf-TfR complex that enters the cell by endocytosis. CD71 is present on actively proliferating cells and is essential for iron transport into proliferating cells.

Selected Validation Data

Various lysates were subjected to SDS PAGE followed by western blot with 88972-1-RR (CD71 antibody) at dilution of 1:5000 incubated at room temperature for 1.5 hours. This data was developed using the same antibody clone with 88972-1-PBS in a different storage buffer formulation.

Untreated and PNGase F-treated lysates of mouse spleen tissue were subjected to SDS PAGE followed by western blot with 88972-1-RR (CD71 antibody) at dilution of 1:5000 incubated at room temperature for 1.5 hours. This data was developed using the same antibody clone with 88972-1-PBS in a different storage buffer formulation.
