Background Information

uPAR, also known as CD87, is a highly glycosylated, GPI-anchored membrane protein. In addition to the membrane-anchored form, uPAR is released from the plasma membrane by cleavage of the GPI anchor and can be found as a soluble form (suPAR). uPAR contains three homologous domains (D1-D3) of which the N-terminal one (D1) represents the uPA-binding domain. After binding to uPAR, uPA cleaves plasminogen, generating the active protease plasmin which is involved in a wide variety of physiologic and pathologic processes. In addition to regulating proteolysis, uPAR has important function in cell adhesion, migration and proliferation. Studies reveal that uPAR expression is elevated during inflammation and tissue remodeling and in many human cancers, in which it frequently indicates poor prognosis. (PMID 20027185; 12461559)

Selected Validation Data

1x10⁶ PMA treated U-937 cells were surface stained with 5 ul APC Anti-Human uPAR/CD87 Rabbit RecAb (APC-FcA98048, Clone: 240366G10) (red) or APC Rabbit IgG Isotype Control RecAb (APC-FcA98136, Clone: 240953C9) (blue). 1x10⁶ untreated U-937 cells were surface stained with 5 ul APC Anti-Human uPAR/CD87 Rabbit RecAb (APC-FcA98048, Clone: 240366G10) (black, dashed). Cells were not fixed.
