Background Information

NADH: ubiquinone oxidoreductase core subunit S8 (NDUFS8), also called TYKY, is an essential core subunit and component of the iron-sulfur (FeS) fragment of mitochondrial complex I directly involved in the electron transfer process and energy metabolism (PMID: 36557887). Pathogenic variants of the NDUFS8 are relevant to infantile-onset and severe diseases, including Leigh syndrome, cancer, and diabetes mellitus (PMID: 36557887). Knockdown of NDUFS8 impaired mitochondrial function, increased ROS, disrupted redox homeostasis, induced apoptosis, and suppressed proliferation and migration of HCC cells (PMID: 40914145).
