Background Information

CD20 is a 33-37 kDa transmembrane phosphoprotein. CD20 is a B-lymphocyte surface molecule that is widely expressed during B-cell ontogeny, from early pre-B-cell developmental stages until final differentiation into plasma $cells. \ CD20 \ functions \ as \ calcium-permeable \ cation \ channel. \ It \ is \ involved \ in \ the \ regulation \ of \ B-cell \ activation \ and \ cells \ activation \ and \ cells \ ce$ proliferation. CD20 serves as a useful target for antibody-mediated therapeutic depletion of B-cells. This antibody is conjugated with CL488(Ex/Em 488 nm/515 nm).
