Background Information

STAT1 (signal transducers and activators of transcription 1) is a member of the STAT protein family. In response to $cytokines\ and\ growth\ factors, STAT\ family\ members\ are\ phosphory lated\ by\ the\ receptor\ associated\ kinases,\ and$ then form homo- or heterodimers that translocate to the cell nucleus where they act as transcription activators. Various ligands, including interferons- and -, EGF, PDGF and IL-6, can activate STAT1. STAT1 protein mediates the expression of a variety of genes, which is thought to be important for cell viability in response to different cell stimuli and pathogens.
