## **Background Information**

Lysine (K)-specific methyltransferase 2C (KMT2C, also known as MLL3) belongs to the mixed-lineage leukemia (MLL) family of histone methyltransferases which methylate the histone 3 tail at lysine 4 (H3K4) as part of the complex proteins associated with Set 1 (COMPASS) complex. Although originally identified as oncogenic fusions in leukemia, genome-wide mutation studies have revealed frequent, presumably loss-of-function, mutations in various members of the MLL family, including MLL2/KMT2B, MLL3/KMT2C, and MLL4/KMT2D in a variety of malignancies, particularly solid tumors. Mechanistic studies of KMT2C in normal cells have focused primarily on its role in enhancer regulation by deposition of H3K4me1 marks.
