Background Information

TGF beta Receptor II (TGFBR2) is a member of the transforming growth factor- β (TGF- β) superfamily, which are critical regulators of cell proliferation and differentiation, developmental patterning and morphogenesis, and disease pathogenesis (PMID: 10974075). TGFBR2 is a serine/threonine kinase and the primary ligand-binding receptor. After binding of the ligand TGF- β 1, TGFBR2 forms a heterodimer complex with TGFBR1, causing conformational changes and signal propagation via canonical (SMAD-dependent) and non-canonical (SMAD-independent) routes. Upon translocation into the nucleus, activated SMAD complexes can interact with various transcription factors to control target gene expression (PMID: 31454892).

Selected Validation Data

1x10⁶ human PBMCs were surface stained with APC Anti-Human CD3, and 5 ul CoraLite® Plus 488 Anti-Human TGFBR2 Rabbit RecAb (CL488-98438, Clone: 250238A7) or CoraLite® Plus 488 Rabbit IgG Isotype Control Recombinant Antibody (CL488-98136, Clone: 240953C9). Cells were not fixed. Lymphocytes were gated.
