Background Information

NLRX1 (Nucleotide-binding oligomerization domain, leucine-rich repeat containing X1) is a member of the NOD-like receptor (NLR) family and is unique among NLRs due to its localization to the mitochondrial matrix. NLRX1 is a negative regulator of innate immunity, particularly in viral infections. It interacts with the mitochondrial antiviral signaling protein (MAVS) to attenuate antiviral responses. NLRX1 has been implicated in various diseases, including multiple sclerosis, colorectal cancer, and ischemia-reperfusion injury. Its role in controlling inflammation and mitochondrial function makes it a potential therapeutic target.
