## **Background Information**

CTCFL, also named BORIS (for brother of the regulator of imprinted sites) is a paralogue of the 11 zinc-finger  $transcription \ factor, \ CTCF.\ It is \ predominantly \ expressed in \ spermatocytes in the \ test is, \ also \ can \ be \ found in \ tumors$ and cancer cell lines. It mainly participates in insulator function, nuclear architecture and transcriptional control, which probably acts by recruiting epigenetic chromatin modifiers. It has a key role in gene imprinting in male germline, by participating in the establishment of differential methylation at the IGF2/H19 imprinted control region (ICR). Directly binds the unmethylated H19 ICR and recruits the PRMT7 methyltransferase, leading to methylate histone H4 'Arg-3' to form H4R3sme2.
