## Background Information

The Delta-Notch pathway is an evolutionarily conserved signaling pathway which controls a broad range of developmental processes including cell fate determination, terminal differentiation and proliferation (PMID: 22353464). In mammals, four Notch receptors (NOTCH1-4) and five activating canonical ligands (JAGGED1, JAGGED2, DLL1, DLL3 and DLL4) have been described (PMID: 22353464). DLL3 is an inhibitory ligand of the Notch signaling pathway that is predominantly localizes to the Golgi apparatus (PMID: 17664336) in normal condition. Normal tissue expression of DLL3 is highest in fetal brain, and DLL3 plays a key role in somitogenesis in the paraxial mesoderm (PMID: 26311731). It has been reported that DLL3 is expressed on the surface of tumor cells of small cell lung cancer (SCLC) and high-grade neuroendocrine carcinomas (LCNEC) and has emerged as a novel therapeutic target (PMID: 26311731; 28487384).
