Background Information

Milk fat globule-epidermal growth factor-factor 8 (MFG-E8), also known as lactadherin, is a multifunctional secreted glycoprotein exhibiting versatile functions in cell physiology affecting health and diseases. It plays roles in clearance of apoptotic cells, anti-inflammatory, wound healing, arterial remodeling, angiogenesis, enhancing tumorigenicity and cancer metastasis (PMID: 23972256). MFG-E8 consists of two-repeated EGF-likedomains, a mucin-like domain and two-repeated discoidin-like domains (C-domains), and contains an integrin-binding motif $(RGD\ sequence)\ in\ the\ EGF-like\ domain\ (PMID:\ 11856354).\ It\ shows\ ubiquitous\ pattern\ of\ expression\ in\ various\ types$ of cells and tissues. Altered expression of MFG-E8 causes disruptions of homeostasis and is correlated with a number of diseases (PMID: 27429513).
