Background Information

Interleukin-2 (IL-2) is a four-helix bundle, type I cytokine that functions as a growth factor for a wide range of leukocytes. In the immune system, IL-2 is essential for immune homeostasis, normal T regulatory cell function, and self-tolerance. It regulates immune cell homeostasis and has been used to treat a range of disorders including cancer and autoimmune disease. IL-2 signals through heterodimerization of the IL-2R β and IL-2R γ receptor subunits (PMID: 25992858, 24907378, 15034008, 17981641).

Selected Validation Data

1x10^6 untreated or PMA and ionomycin treated rat splenocytes were intracellularly stained with FITC Plus Anti-Rat CD4 and 0.25 ug CoraLite® Plus 750 Anti-Rat IL-2 Rabbit Recombinant Antibody (CL750-98046, Clone: 240264C7). Cells were fixed with 4% PFA and permeabilized with Flow Cytometry Perm Buffer (PF00011-C).
