Background

Biglycan is a member of the small leucine-rich proteoglycan (SLRP) family. It consists of a core protein that containing leucine-rich repeats (LRRs), to which two chondroitin/dermatan sulfate side chains are covalently bound. The tissue-specific chondroitin- or dermatan-sulfate glycosaminoglycan chains of biglycan are attached to amino acid residues at the N-terminus of the core protein. Biglycan is a ubiquitous component of connective tissue matrix and may act as a signaling molecule. Upregulation of biglycan has been reported in multiple types of solid cancer.
