Background

The electron transfer flavoprotein(ETF), located in the mitochondrial matrix, is a nuclear-encoded enzyme delivering to the respiratory chain by straight-chain acyl-CoA dehydrogenases and other dehydrogenases. Mitochondrial fatty acids oxidation and amino acids metabolism are affected in MADD(Multiple acyl-CoA dehydrogenase deficiency). These disorders are linked to a dysfunction of ETF. ETF is a mitochondrial matrix protein consisting of alpha- and beta- subunits encoded by the ETFA and ETFB genes, respectively.

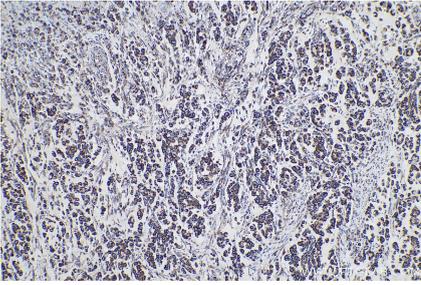

Synonyms

Alpha ETF, EMA, ETFA, GA2, MADD
