Background

NCOR2, nuclear receptor corepressor 2, is a transcriptional corepressor that contains several nuclear receptor-interacting domains. NCOR2/SMRT acts as a platform protein, facilitating the recruitment of histone deacetylases to the DNA promoters bound by its interacting transcription factors. NCOR2 mediates the transcriptional repression activity of some nuclear receptors by promoting chromatin condensation, thus preventing access of the basal transcription.

Synonyms

SMAP270, Nuclear receptor corepressor 2, N-CoR2, N CoR2, CTG26

Selected Validation Data
