Background

STT3B is a component of the N-oligosaccharyl transferase (OST) enzyme which catalyzes the transfer of a high mannose oligosaccharide from a lipid-linked oligosaccharide donor to an asparagine residue within an Asn-X-Ser/Thr consensus motif in nascent polypeptide chains. N-glycosylation occurs cotranslationally and the complex associates with the Sec61 complex at the channel-forming translocon complex that mediates protein translocation across the endoplasmic reticulum (ER). STT3B seems to be involved in complex substrate specificity.

Synonyms

Dolichyl-diphosphooligosaccharide--protein glycosyltransferase subunit STT3B, EC:2.4.99.18, SIMP, Source of immunodominant MHC-associated peptides homolog, STT
