Background Information

CD206, also named as MMR, CLEC13D and MRC1, is a type I membrane receptor that mediates the endocytosis of glycoproteins by macrophages. CD206 has been shown to bind high-mannose structures on the surface of potentially pathogenic viruses, bacteria, and fungi so that they can be neutralized by phagocytic engulfment. CD206 is a 170 kDa transmembrane protein which contains 5 domains: an amino-terminal cysteine-rich region, a fibronectin type II repeat, a series of eight tandem lectin-like carbohydrate recognition domains (responsible for the recognition of mannose and fucose), a transmembrane domain, and an intracellular carboxy-terminal tail. It is expressed on most tissue macrophages, in vitro derived dendritic cells, lymphatic and sinusoidal endothelia.

Selected Validation Data

1×10^6 GM-CSF treated human PBMCs were surface stained with 5 μ l PE Anti-Human CD206 (15-2) (PE-65155, Clone:15-2) (red) or PE Mouse IgG1 Isotype Control (MOPC-21) (PE-65124, Clone: MOPC-21) (blue). 1×10^6 untreated human PBMCs were surface stained with 5 μ l PE Anti-Human CD206 (15-2) (PE-65155, Clone: 15-2) (black, dashed). Cells were not fixed.
