Background Information

CD63 is a 30-60 kDa lysosomal membrane protein that belongs to the tetraspanin family. This protein plays many important roles in immuno-physiological functions. It mediates signal transduction events that regulate cell development, activation, growth, and motility. CD63 is expressed on activated platelets, thus it may function as a blood platelet activation marker. CD63 is a lysosomal membrane glycoprotein translocated to the plasma membrane after platelet activation. The CD63 tetraspanin is highly expressed in the early stages of melanoma and decreases in advanced lesions, suggesting it is a possible suppressor of tumor progression. Deficiency of this protein is associated with Hermansky-Pudlak syndrome.

Selected Validation Data

1x10^6 thrombin-treated human peripheral blood platelets were surface stained with 5 ul PE Anti-Human CD63 Rabbit RecAb (PE-98318, Clone: 241964E1) (red) or PE Rabbit IgG Isotype Control RecAb (PE-98136, Clone: 240953C9) (blue). 1x10^6 untreated human peripheral blood platelets were surface stained with 5 ul PE Anti-Human CD63 Rabbit RecAb (PE-98318, Clone: 241964E1) (black, dashed). Cells were not fixed.
