## Background Information

IL-17A, also named as IL-17, is a proinflammatory cytokine. IL-17, synthesized only by memory T cells and natural killer cells, has pleiotropic effects, mainly in the recruitment and activation of neutrophils. This cytokine regulates the activities of NF-kappaB and mitogen-activated protein kinases. This cytokine can stimulate the expression of IL6 and cyclooxygenase-2 (PTGS2/COX-2), as well as enhance the production of nitric oxide (NO). High levels of this cytokine are associated with several chronic inflammatory diseases including rheumatoid arthritis, psoriasis and multiple sclerosis. The IL-17 receptor is a type I transmembrane protein, that is widely expressed on epithelial cells, fibroblasts, B and T cells, and monocytic cells. In psoriatic skin lesions, both Th17 cells and their downstream effector molecules, e.g. IL-17 and IL-22, are highly increased.

## Selected Validation Data

1x10<sup>6</sup> untreated or PMA and ionomycin treated BALB/C Th17-polarized BALB/C splenocytes were intracellularly stained with CoraLite® Plus 750 Anti-Mouse CD4 and 0.1 ug PE Anti-Mouse IL-17A Rabbit RecAb (PE-FcA98005, Clone:230038C7). Cells were fixed with 4% PFA and permeabilized with Flow Cytometry Perm Buffer.
