Background Information	CD73 is a membrane-bound enzyme that catalyzes the extracellular hydrolysis of adenosine monophosphate (AMP) to produce adenosine. It is expressed on various immune cells, including T cells, B cells, dendritic cells, and regulatory T cells (Tregs). CD73 works in conjunction with CD39 to break down extracellular ATP into adenosine, creating an immunosuppressive environment that can inhibit the function of cytotoxic T cells and natural killer (NK) cells. This process is essential for immune tolerance and the resolution of inflammation. CD73 is also an important player in controlling tumor progression.
